Applied AI Evidence Portfolio

Study, projects, research and practice across a documented two-year window

Feven Abebe Bejiga

Addis Ababa, Ethiopia

Public edition - applied AI evidence

Nov 2024 — Nov 2026

Prepared 9 November 2026 | github.com/fevenabebe | linkedin.com/in/feven-abebe-459b15211

EXECUTIVE PROFILE

An applied AI practitioner grounded in health systems

Feven Abebe Bejiga is an applied AI/ML practitioner based in Addis Ababa. She holds a BSc in Health Informatics from the University of Gondar (2022, CGPA 3.86/4.00) and is completing an MSc in Artificial Intelligence at Addis Ababa University. Her path runs from implementing health information systems in Ethiopian facilities into machine learning, computer vision, NLP and retrieval-augmented generation, data engineering and federated-learning research.

This portfolio documents what can be evidenced between **November 2024 and November 2026**: dated public code, notebooks, model files, a conference paper accepted for presentation, structured training and professional data work. It is deliberately **not** a CV and it does not describe two years of continuous paid AI employment. Each entry says what kind of activity it was (employment, study, coursework, independent project, team project, training or research) and how it was verified.

Education	BSc Health Informatics, University of Gondar (2022), CGPA 3.86/4.00. MSc Artificial Intelligence, Addis Ababa University (started November 2024, in progress).
Location	Addis Ababa, Ethiopia
Links	github.com/fevenabebe | feven-portfolio-six.vercel.app | linkedin.com/in/feven-abebe-459b15211

Professional strengths

- Python and SQL
- Machine learning and deep learning
- Computer vision
- NLP and retrieval-augmented generation (RAG)
- Data engineering and validation
- Federated-learning research
- Responsible and trustworthy AI
- Digital health implementation
- Technical documentation and capacity building

What this portfolio claims
Sustained AI-related study, experimentation and research across the window, evidenced by dated public repositories, notebooks and model files; an MSc in progress; a federated-learning paper accepted for presentation (applicant-reported); and digital-health and data-science work that gives practical insight into the settings where AI is meant to help.

What it does not claim
Two years of continuous paid AI employment; clinical validity or diagnostic readiness of any healthcare model; field deployment or commercial launch of any prototype; a completed thesis; a published Springer CCIS paper; or sole authorship of team projects.

How to read the evidence labels

Verified repository record	A fact checked directly in the repository (file, JSON report, commit metadata).
Source-code evidence	Implemented in the repository's source files; results not necessarily included.
Notebook evidence	Executed notebooks in the repository, with outputs visible where quoted.
Reported experimental result	A number stated by the applicant or in a README and not re-run here.
Official training record	A certificate or institutional record. None was supplied, so none is claimed.
Accepted for presentation	Conference acceptance reported by the applicant; notification letter not supplied.
Work in progress	Ongoing; no completed findings are claimed.
Requires additional verification	Cannot be established from the supplied evidence.

TWO-YEAR EVIDENCE OVERVIEW

Different kinds of evidence, kept separate

The window is documented through several independent evidence types. They are not interchangeable, and none of them is presented as continuous AI employment.

Evidence type	What it covers	Period	Verification status
Postgraduate study	MSc Artificial Intelligence, Addis Ababa University; thesis in progress.	Nov 2024 - present	Work in progress
Coursework and exercises	AI Principles assignments (A*, Minimax, search); ML, deep-learning and probabilistic-model notebooks.	Dec 2024 - Oct 2025 (repo dates)	Source-code evidence Notebook evidence
Structured training	Qiyas / AAU Data Science and AI Engineering; GCI World Data Science; SAFEE KAIM (Kifiya AI Mastery, 10 Academy cohort).	Apr - Sep 2026	Official training record (GCI, KAIM) Requires additional verification (Qiyas)
Independent projects	Lane-following robot, pneumonia-detection prototypes, AgriMind RAG prototype, health-data pipeline, CoffeeTrace, DHIS2 metadata prototype.	Jun 2025 - Nov 2026	Source-code evidence
Team projects	House-price prediction and Addis ride-demand forecasting (Qiyas-linked team work).	Jul - Nov 2026	Verified repository record
Research	Federated-learning client-selection paper (PanAfriCon AI 2026); MSc thesis.	2026	Accepted for presentation Work in progress
Professional data work	CDHi, University of Gondar (digital health: Fellow, then Digital Health Developer); Ethiopian Statistics Service data-science internship (from Oct 2026). Not AI-model development.	Nov 2022 - Jan 2026; Oct 2026 - present	Requires additional verification

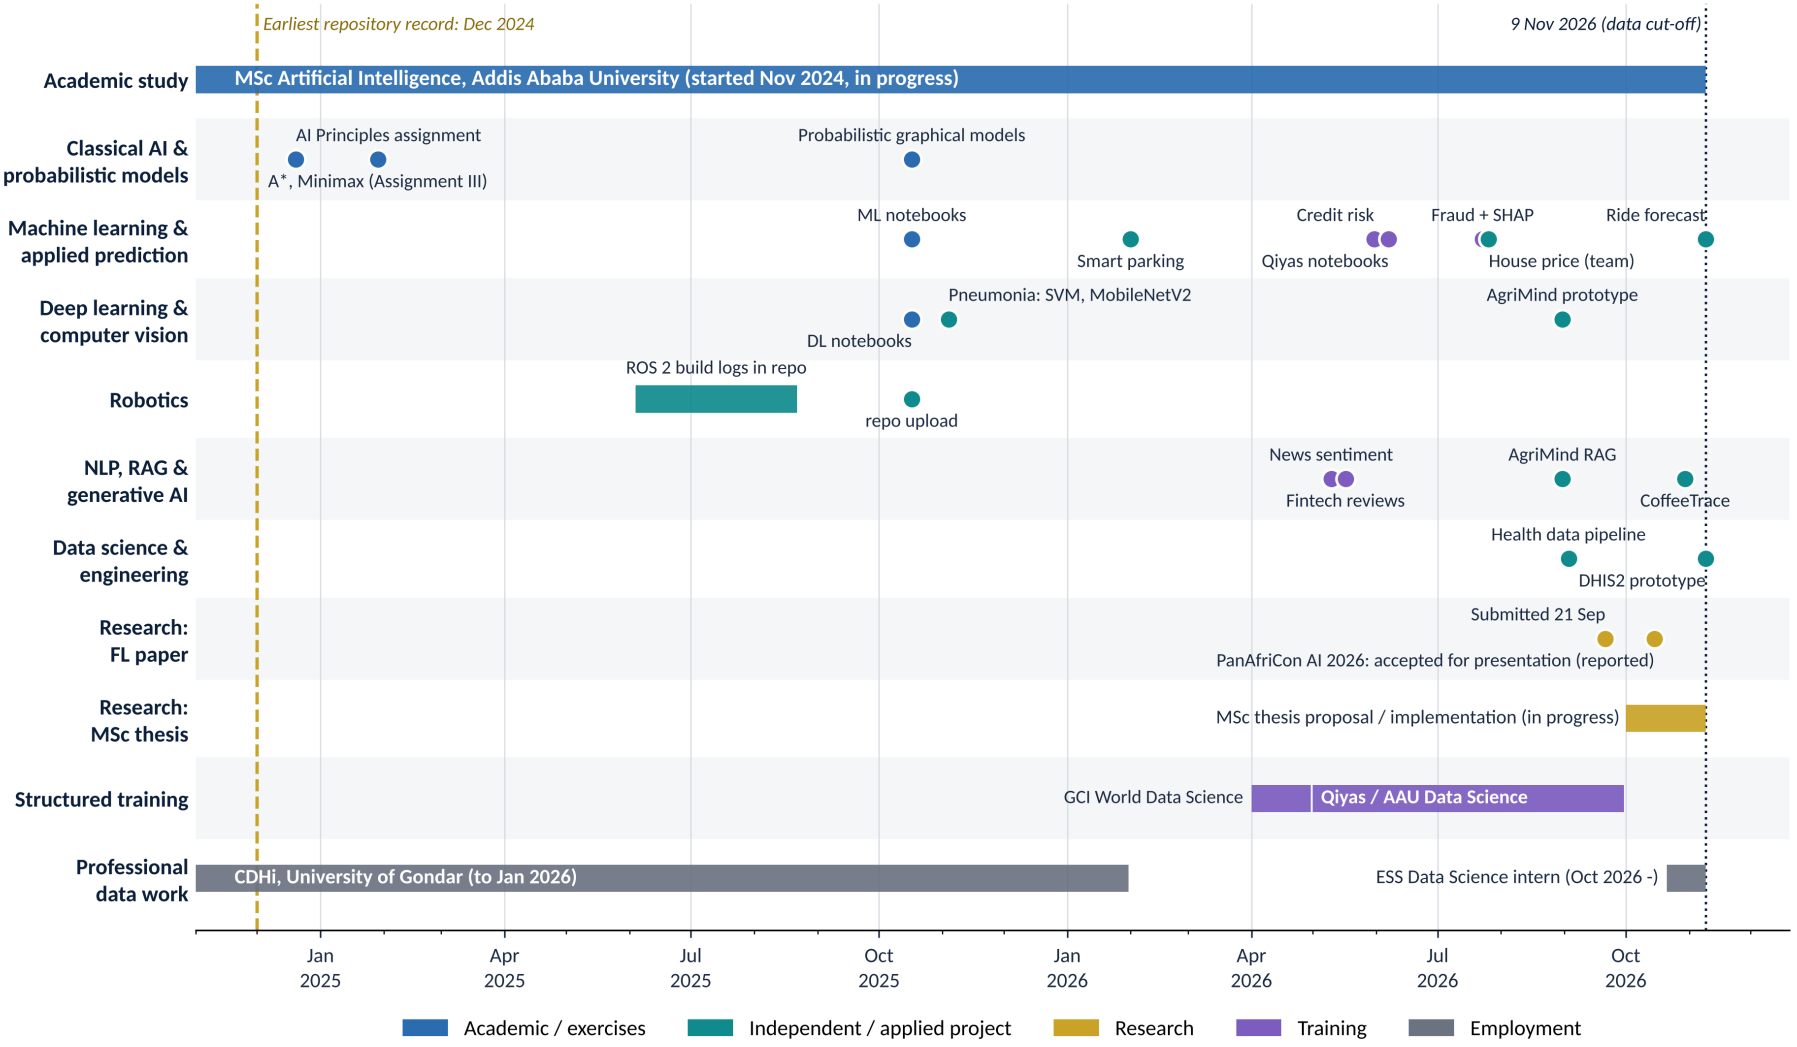

How the 33 repositories were classified

All 33 repository names matched the supplied repository list. Each was cloned and inspected (README, source, notebooks, model files, requirements, commit history) before being classified. Only repositories with genuine AI/ML content that the applicant can stand behind are counted in the charts. At the applicant's request, the CDHi project-management system and the personal website are excluded as non-AI.

Classification	Repos	Which ones, and why
Counted as AI evidence	20	Classical AI (3), ML / DL notebooks (2), robotics, pneumonia (2), smart parking, NLP and RAG (4), ML projects (5), data engineering (2). See the evidence table on page 12.
Computational foundations	2	Advanced-Problem-solving, Random-Number-Generation: maze solving, Monte Carlo. Supporting only.
Supporting data analysis	3	Insurance-Risk-Analysis, solar-challenge-week0, climate-challenge-week0: EDA and dashboards without a model.
Template, scaffold, empty or duplicate	5	chatbot and chatbot-1 (stock Streamlit template), news-sentiment-stock-movement (scaffold), Emotion-Detection (empty), solar-challenge-week000000 (duplicate).
Attribution not verified	1	coffee-guard-ai: README and CI badge point to another GitHub owner (Ab-xo); one squashed commit. Not claimed.
Not AI (applicant instruction)	2	Project-Management-System---CDHi-sample; feven-portfolio (personal website).

Commit counts are recorded per repository in the accompanying CSV but are deliberately not used as a measure of expertise, and repository creation dates are never treated as project start dates: several repositories were uploaded in bulk (seven on 17 October 2025; three on 9 November 2026).

Two-year AI development timeline | November 2024 - November 2026

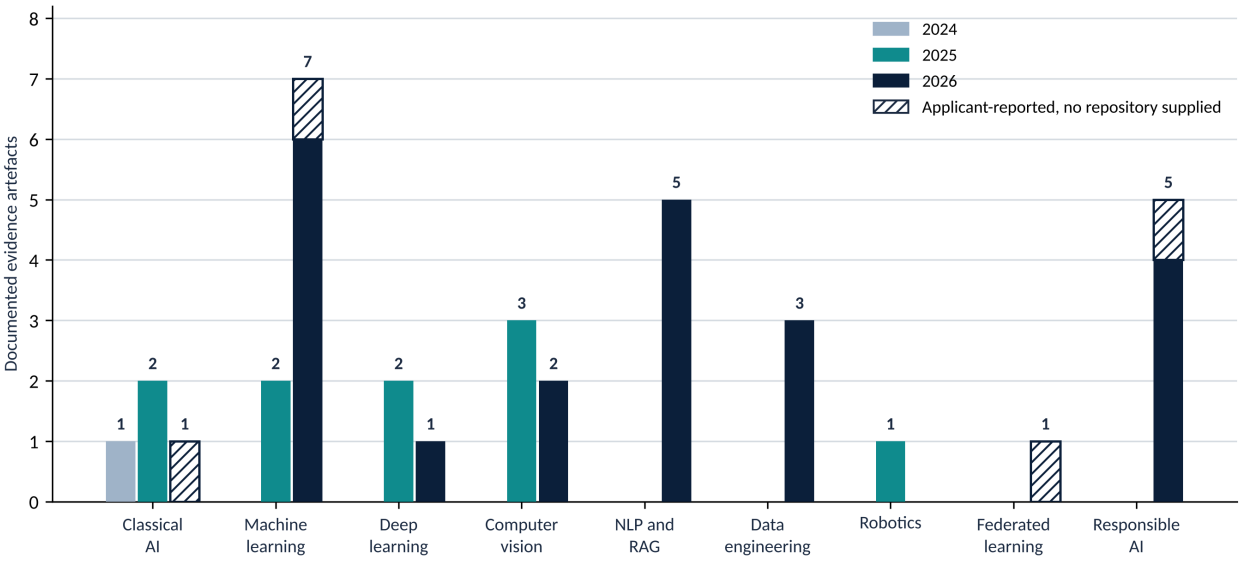

Dots = first recorded commit by the applicant's account (an evidence date, not a project start date); bars = periods. ML / DL / probabilistic notebook repos are shown as 'Academic / exercises'; their course context is not stated in the repos. SAFEE KAIM: certificate dated Aug 2026 for a 3-month programme; start date not stated, so not drawn. GCI: April 2026 course, certificate issued 31 Aug 2026. CDHi bar is clipped to the evidence window (Nov 2022 - Jan 2026).

TECHNICAL EVIDENCE

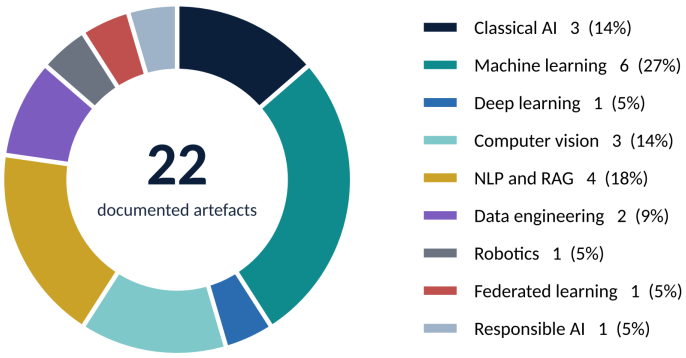

What was documented, and in which domain

Technical domains by year | documented evidence artefacts, not skill proficiency

Rule: an artefact is placed in the year of its first recorded commit by the applicant's account (reported items: 2026). An artefact touching several domains counts once in each, so bars sum to more than the 22 artefacts. Counted: 20 AI-relevant repositories + 2 applicant-reported items. Templates, empty, unverified-attribution and non-AI repositories are excluded.

AI project portfolio distribution | one primary domain per artefact

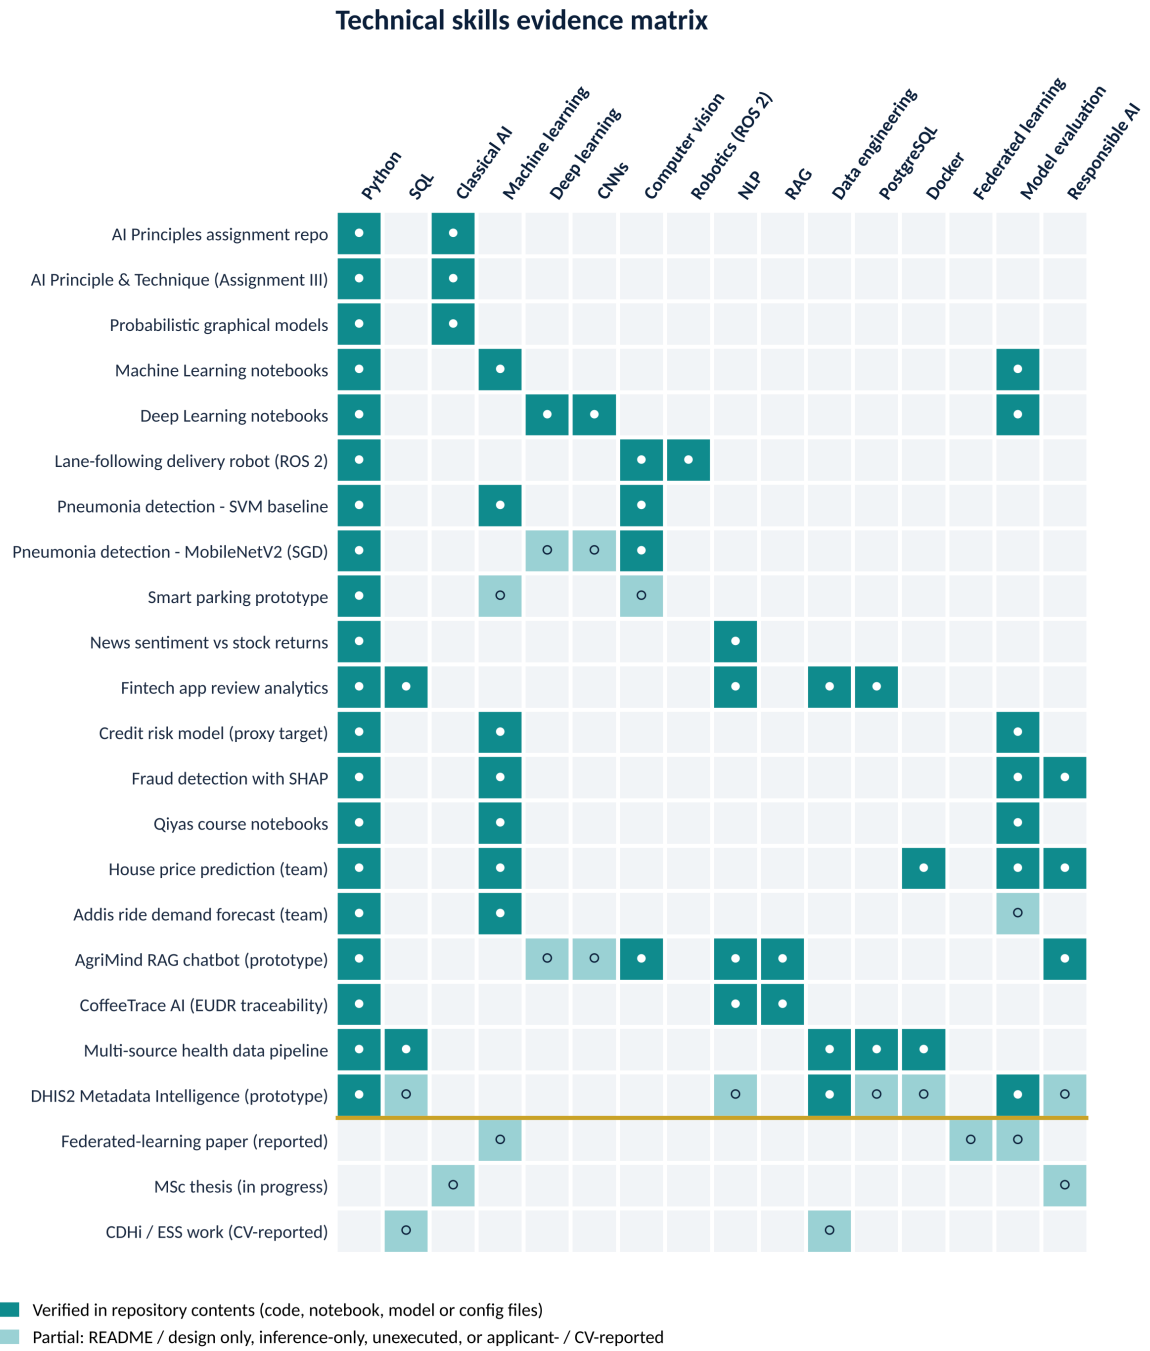

Mutually exclusive: each of the 22 artefacts (20 repositories + 2 applicant-reported items) is assigned to the single domain of its main deliverable, so nothing is double-counted. AgriMind (image classification + RAG) is classed as NLP and RAG because its main deliverable is the retrieval-grounded advisory app. Overlap: see the year chart and the matrix.

Classification rules. Domains are assigned from repository contents, not from titles. Classical AI: search, Minimax, probabilistic graphical models. Computer vision includes classical OpenCV pipelines. Responsible AI is assigned only where explainability (SHAP) or explicit safeguards exist in the code or design. The 2024 column is thin because the evidence window opens in late 2024 and the first repository is dated 20 December 2024.

TECHNICAL EVIDENCE

Skills evidence matrix

Each filled cell means the skill appears in the repository's actual files. Outlined cells mean documentation-only, inference-only, unexecuted or applicant/CV-reported evidence. A skill is listed only where supporting material exists; nothing here is a proficiency rating.

RESEARCH

Federated learning: client selection under resource limits

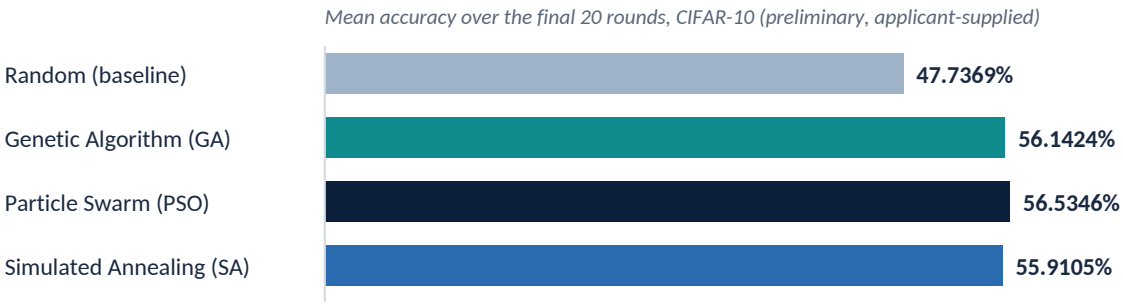

Lightweight Metaheuristic Optimization for Client Selection in Resource-Constrained Federated Learning Systems

Venue	PanAfriCon AI 2026 (Addis Ababa, 15-16 October 2026), submission ID 131
Status	Accepted for presentation applicant-reported; notification letter not supplied. Publication in Springer CCIS is not claimed.
Authors	Co-authored with Zehara Yassin and Beakal Gizachew (Addis Ababa University). Applicant's individual contribution to be described in interview.
Materials	No repository, notebooks or CSVs for this work were in the supplied files; figures below are applicant-supplied. Requires additional verification

Problem and approach

In federated learning, only a subset of clients can take part in each round, and clients differ in data distribution, compute and connectivity. The paper studies **which clients to select** when resources are limited. Three lightweight metaheuristics, **Genetic Algorithm (GA)**, **Particle Swarm Optimization (PSO)** and **Simulated Annealing (SA)**, are compared with **Random** selection and with greedy, proportional and round-robin baselines. Training uses FedProx on **non-IID** partitions of FEMNIST, CIFAR-10 and CIFAR-100 (per the applicant's CV), over multiple seeds (five seeds, 100 rounds in the submitted protocol, as reported by the applicant), with client-selection logs and accuracy evaluation per round.

Preliminary CIFAR-10 comparison

Strategy	Final-20-round mean accuracy	Difference vs Random
Random	47.7369%	baseline
GA	56.1424%	+8.41 percentage points
PSO	56.5346%	+8.80 percentage points
SA	55.9105%	+8.17 percentage points

Reported experimental result

These are **preliminary** figures supplied by the applicant. In this comparison all three metaheuristics outperform Random selection by roughly 8-9 points. The three differ from each other by under 0.7 points, and no significance test was supplied, so **no ranking among GA, PSO and SA is claimed**. Results for the greedy, proportional and round-robin baselines, CIFAR-100, and the complete multi-seed protocol must be checked against the experiment CSVs and notebooks before any figure is presented as final.

APPLIED AI

AgriMind and healthcare computer-vision prototypes

AgriMind: crop-disease information assistant

Source-code evidence NLP and RAG | computer vision | deep learning | responsible AI | first commit 31 Aug 2026 | github.com/fevenabebe/AgriMind_AI_RAG_Chatbot

AgriMind Shield is the concept: lightweight crop-disease image classification combined with retrieval-grounded advice, aimed at agricultural extension workers in resource-constrained settings. The repository contains the first working prototype of that concept, and the two should not be confused.

Verified in the repository

- EfficientNet-based Keras classifiers: wheat (healthy, septoria, stripe rust) and maize (healthy, maize lethal necrosis, maize streak virus).
- Image pre-processing and classifier module (*src/classifier.py*).
- FAISS vector retrieval with all-MiniLM-L6-v2 embeddings over a curated 29-entry knowledge base.
- Gemini API response generation with explicit safety rules in the prompt; Streamlit interface.

Not established; not claimed

- Offline operation: the prototype calls the Gemini API and needs internet access.
- Multilingual retrieval: the embedding model used is English-oriented; no multilingual pipeline was found.
- MobileNet exploration: not found; only EfficientNet models are present.
- Training notebooks, datasets or accuracy figures: none in the repository.
- Field deployment or commercial launch: none. This is a prototype.

Pneumonia detection: two prototypes, one real mismatch

Source-code evidence computer vision | educational / research prototypes, 4 Nov 2025 | Penmonia-Detection-SVM | Penmonia-Detection-SGD

	Penmonia-Detection-SVM	Penmonia-Detection-SGD
README says	MobileNetV2 transfer learning	MobileNetV2 transfer learning
Code actually contains	Streamlit app + saved SVM classifier on flattened 64x64 grayscale chest X-rays (classical ML baseline). No MobileNet.	Saved MobileNetV2 model (*MobileNetV2_BEST_SGD.keras*) loaded by a Streamlit app; also holds the SVM app.
Not in the repository	Training code, dataset description, metrics	Training code, dataset description, metrics

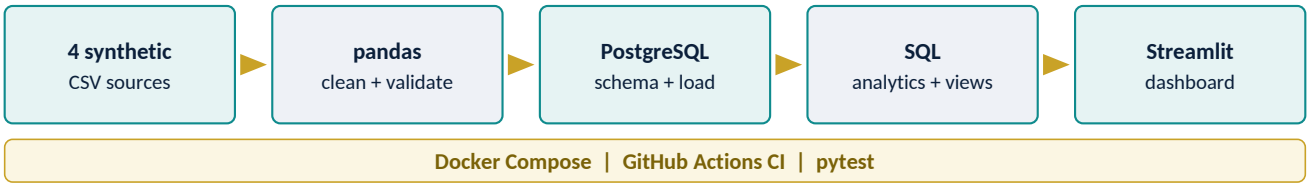

Limits. These are educational and research prototypes. They have **no clinical validation**, no documented dataset provenance, and no reported accuracy, and they are not diagnostic tools. The repository names (SVM, SGD) and the README text do not align with the code, so the README was not used as evidence. Preprocessing in the SGD repository's SVM app differs from the SVM repository's (224x224 RGB vs 64x64 grayscale); consistency was not verified.

DATA ENGINEERING, MACHINE LEARNING AND DEEP LEARNING

Pipelines, notebooks and models

Multi-source health data pipeline

Source-code evidence data engineering | 3 Sep 2026 | github.com/fevenabebe/multi-source-health-data-pipeline

- **Synthetic data only:** disease cases, facilities, monthly indicators and patient visits are generated by the repository; no real patient data is involved.
- **Verified:** ETL, schema, SQL views, dashboard, Docker and CI files exist. All 15 pytest tests passed when re-run for this portfolio.
- **Not executed here:** PostgreSQL loading, the Docker stack and the dashboard. A later commit makes the dashboard run from BI-ready CSVs without PostgreSQL. No deployment is claimed.

Machine-learning and deep-learning notebooks

Repository	What the notebooks contain	Verified result
Machine_Learning Notebook evidence	Classification, regression, L1/L2 regularisation, and an urban air-quality classification with a tuned Random Forest (4 notebooks).	Air-quality test accuracy 0.9876, as printed in the notebook output.
Deep-Learning Notebook evidence	PyTorch: AlexNet-style CNN classification, optimiser comparison on a CNN, MLP activation-function and depth experiments (3 notebooks).	Outputs present in notebooks; no figures quoted here.
Probabilistic-graphical-model Notebook evidence	Directed and undirected graphical models and a probability exercise (3 notebooks).	Exercises; no metrics.

Applied prediction projects

Project	Approach	Result and label
House price prediction Team project, Jul - Nov 2026	Ames housing regression; preprocessing and feature engineering; CatBoost, XGBoost, LightGBM; SHAP; Streamlit and FastAPI; Docker; CI. 73 of 74 commits are from the applicant's account; team composition is not documented.	Tuned CatBoost R2 0.9371, RMSE 18,636 from *outputs/reports/final_evaluation.json*. Verified repository record
Addis ride demand forecast Six-person team, imported 9 Nov 2026	LightGBM (Poisson) hourly demand by zone, rolling-origin validation, FastAPI service. Individual contribution is not itemised in the single imported commit.	README: validation RMSE 8.09 vs 9.94 for the best baseline. Reported experimental result
Fraud detection Training challenge, Jul 2026	E-commerce and credit-card fraud: EDA, SMOTE for class imbalance, Logistic Regression vs Random Forest, SHAP explainability notebooks.	README: Random Forest AUC-PR 0.7137 and 0.7801. Reported experimental result
Credit-risk model Training challenge, May - Jun 2026	Data processing, Logistic Regression and Random Forest with grid search and MLflow on an RFM-based proxy target.	README also lists FastAPI, Docker and CI/CD that are not in the repo, so they are not claimed. Source-code evidence

APPLIED AI

Robotics, NLP and generative-AI prototypes

Lane-following delivery robot (ROS 2 + Gazebo) Source-code evidence

Robotics | classical computer vision | control

An autonomous delivery-robot concept in which the robot follows a lane. The source implements an OpenCV pipeline (HSV colour mask and contour detection) that feeds a controller with PID-style steering, packaged as a ROS 2 workspace. It is classical vision and control, not a learned model, and is presented as such. Build-log folders dated 4 June to 22 August 2025 are present, which places this work earlier than the repository's 17 October 2025 upload date.

https://github.com/fevenabebe/Robotics---AutoNavigate

News sentiment and stock returns Notebook evidence

NLP | training challenge | May 2026

Headline statistics, VADER sentiment scoring and correlation with stock returns across five tickers, in 11 notebooks with tests. The README mentions ML classifiers that are not visible in the notebooks, so only sentiment scoring and correlation analysis are claimed.

https://github.com/fevenabebe/News-sentimental-analy

Fintech app review analytics Source-code evidence

NLP | data engineering | PostgreSQL | training challenge | May 2026

Google Play reviews for three Ethiopian banking apps are scraped, cleaned, scored with VADER, grouped into themes and stored in PostgreSQL through a SQL schema and loader, with a pytest smoke test.

https://github.com/fevenabebe/Fintech-Review-Analytics

CoffeeTrace AI: deforestation-risk traceability assistant Source-code evidence

RAG | generative AI | Oct 2026 | single commit

A Colab notebook and Streamlit app combining a Global Forest Watch query, Gemini multimodal analysis and RAG question answering over EU Deforestation Regulation text (ChromaDB, LangChain). It depends on external APIs, has no evaluation results and is a prototype.

https://github.com/fevenabebe/coffeTrace

DHIS2 Metadata Intelligence Source-code evidence

Data engineering | NLP | responsible-AI design | Nov 2026 | single commit

A read-only decision-support prototype for finding duplicate or overlapping DHIS2 data elements, datasets and indicators, using TF-IDF similarity and a dependency graph (FastAPI, React). The client has no write calls, so human review stays in the loop. The README states its own verification limits: 77 tests reported on SQLite and mocked DHIS2 (not re-run here); sentence-transformer embeddings, PostgreSQL and Docker were not exercised. It is a prototype.

https://github.com/fevenabebe/dhis2-metadata-intelligence

Smart parking prototype Source-code evidence

Computer vision | machine learning | Feb 2026

A Streamlit app that loads a pickled SVM and background-subtraction model; the video loop uses placeholder classes. Training code is not in the repository and the accuracy stored in the model file was not verified, so no accuracy is claimed.

https://github.com/fevenabebe/smart-parking-app

MSC RESEARCH AND PROFESSIONAL EXPERIENCE

Trustworthy prediction, and the settings it must work in

MSc thesis (working title)

Selective Neuro-Symbolic Prediction with Proof-Based Acceptance under Concept and Rule Shift

Work in progress Addis Ababa University, MSc Artificial Intelligence. No experimental findings are claimed.

Motivation. Predictive systems used for decisions fail quietly when the world changes. The thesis investigates prediction under **concept shift** and under changes to **symbolic rules**, and asks when a system should accept, and when it should **abstain**. The direction combines neuro-symbolic prediction with **proof-based acceptance**, **selective prediction** and **uncertainty** estimation, aimed at trustworthy decision support.

Professional experience

Big Data / Data Science Intern, Ethiopian Statistics Service (ESS) Requires additional verification

October 2026 - present | formal unit name provisional

Data reconciliation using DuckDB, statistical data extraction, provenance-first workflows, source traceability and structured data validation. This supports reliable, evidence-based data workflows. It is **not** described as an AI-model development role.

Center for Digital Health and Implementation (CDHi), University of Gondar Requires additional verification

November 2022 - January 2026 | Fellow (Nov 2022 - Jun 2023), then Digital Health Developer (Jul 2023 - Jan 2026) | digital health, kept separate from AI

Implementation of Bahmni and DHIS2 in routine health-information systems; a SQL-based EMR reporting module used at three healthcare facilities; DHIS2 validation and program rules; indicators across areas such as ANC, family planning, NCD, inpatient and outpatient services, PICT and TB; WHO Digital Adaptation Kit workflows for ANC and family planning; training of more than 100 nurses, physicians and other staff; technical documentation, user support and troubleshooting.

Why this matters for AI work. Health-system implementation teaches things that models do not: how data is actually captured, where quality breaks down, what facilities can sustain, and why tools fail when users are not trained or consulted. The prototypes above reflect that perspective in their design: synthetic data where real data is not available, read-only access, and explicit statements of their own limits.

Education and training

Programme	Detail	Status
MSc Artificial Intelligence	Addis Ababa University. Started November 2024. Thesis in progress.	Work in progress
BSc Health Informatics	University of Gondar, 2022. CGPA 3.86/4.00.	Requires additional verification
Qiyas / AAU Data Science and AI Engineering	May - September 2026. World Bank-supported. Course notebooks and group assignments in the Qiyas repository. Certificate not supplied.	Requires additional verification
SAFEE KAIM: Kifiya AI Mastery Training Program	10 Academy women-only cohort, Mastercard Foundation-supported. Certificate of Completion, August 2026: 3-month programme with 12 weeks of project-based ML engineering, data engineering and fintech financial analysis.	Official training record
GCI World Data Science	Course 'GCI World April 2026', Matsuo-Iwasawa Laboratory, University of Tokyo. Certificate issued 31 August 2026; final assessment passed.	Official training record

GCI and KAIM certificates were checked (PDFs in the applicant's earlier portfolio repository). The May - July 2026 task-style repositories fall within the KAIM period, but they do not state a programme link and none is asserted.

EVIDENCE LINKS

Where each claim can be checked

First commit = the earliest commit by the applicant's account in the repository history (an evidence date, not a start date). Full classification of all 33 repositories: GitHub_Evidence_Classification.csv.

VERIFICATION NOTES

What was checked, and what remains open

Ref	Topic	Note
V1	**Evidence window**	The MSc began in November 2024; the earliest repository record is 20 December 2024. The window is therefore stated as November 2024 to November 2026.
V2	**Dates**	Creation and commit dates are repository records, not project start dates. Bulk uploads: seven repositories on 17 October 2025 and three single-commit repositories on 9 November 2026 (ride forecast, DHIS2 prototype, CoffeeGuard AI). Development time before upload is unknown, except where build logs exist (robotics).
V3	**Commit history**	The commit history used here was regenerated from the public repositories' git logs (UTC) and spot-checked against the supplied commit CSV (counts and first/last dates). Repository metadata comes from the supplied repository CSV; PowerShell-style language values were normalised.
V4	**CDHi dates**	November 2022 to January 2026 comprises a fellowship (Nov 2022 - Jun 2023) and a Digital Health Developer role (Jul 2023 - Jan 2026), as stated in the applicant's earlier portfolio site and CV. No employment letter was supplied.
V5	**Team projects**	House-price prediction and ride-demand forecasting are team projects. Contribution beyond commit authorship cannot be established from the repositories and is not claimed.
V6	**CoffeeGuard AI**	Excluded. The repository's README and CI badge point to a different GitHub owner and the app contains an 'About Team' page; the applicant's contribution is not established. Do not cite it without written clarification of authorship.
V7	**README versus code**	Pneumonia-SVM, Credit-Risk and News-sentiment READMEs describe things the code does not contain. Only what the code shows is claimed.
V8	**Templates and empty repos**	chatbot, chatbot-1 (stock template), news-sentiment-stock-movement (scaffold), Emotion-Detection (empty) and a duplicate solar repository are not counted.
V9	**Research and training**	The federated-learning acceptance, experimental figures, co-authors, MSc progress and the Qiyas programme are applicant-reported. GCI World and SAFEE KAIM certificates were viewed and match the dates stated here.
V10	**Re-run checks**	The 15 pytest tests of the health-data pipeline were re-run and passed. No model, dashboard or container from any repository was retrained, deployed or run for this portfolio.

Applicant statement

> I have developed AI-related knowledge and practical capabilities through sustained postgraduate study, technical projects, applied experimentation, research, structured training, and real-world digital development experience across the November 2024 - November 2026 evidence period. My background in health informatics and public-sector data gives me practical insight into the environments where responsible AI can create meaningful value in Africa.
>
> **Feven Abebe Bejiga** | Addis Ababa, 9 November 2026
